Philadelphia Water Department

One Water Utility

Drinking Water

- Source: Delaware and Schuylkill Rivers
- 1.6 million drinking water customers
- Three Water Treatment Facilities
- Over 300 million gallons treated per day
- 3,000 miles of water mains, 25+ pumping stations

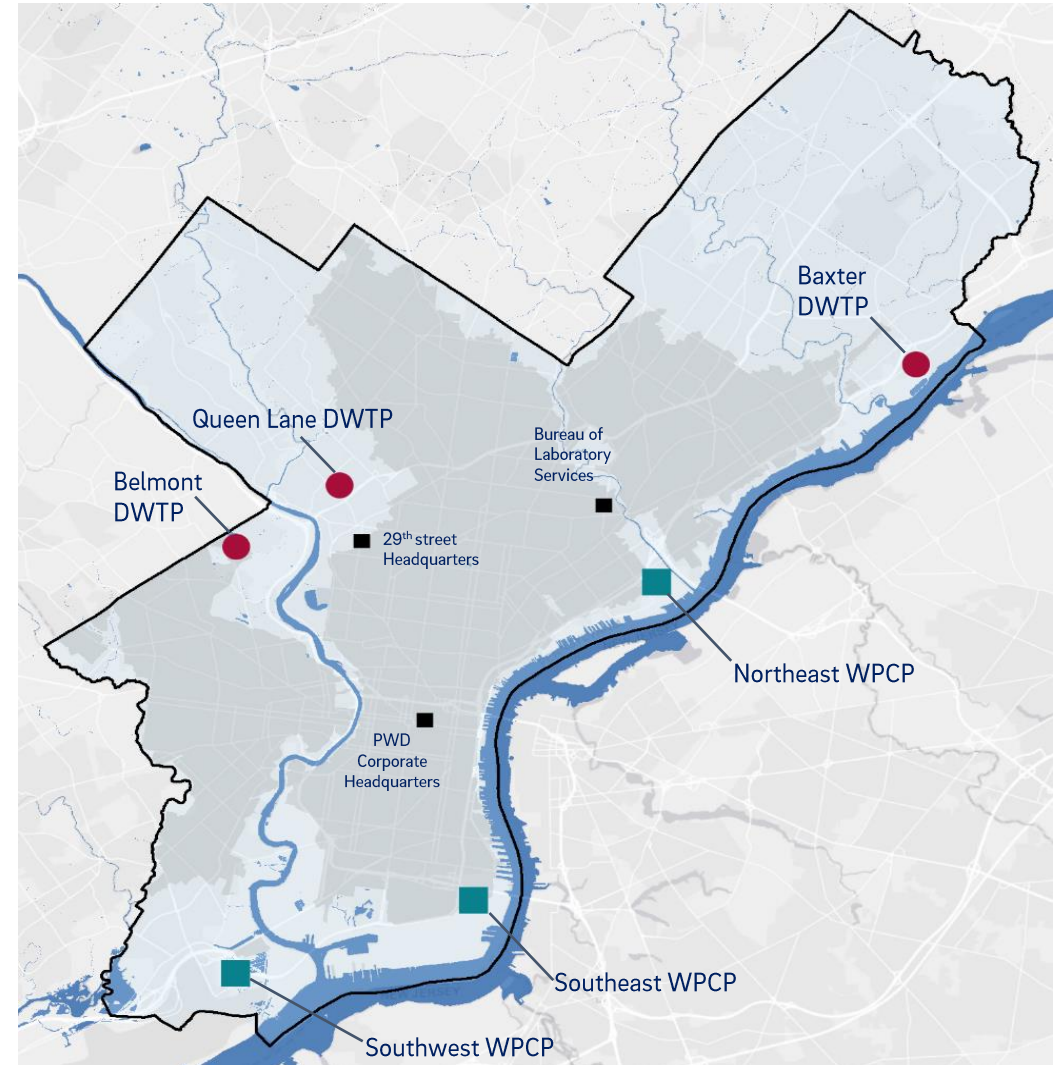

Wastewater

- 2.2 million wastewater customers
- 3 Water Pollution Control Plants
- Over 522 million gallons treated per day
- 3,716 miles of sewers, 19 pumping stations

Stormwater

- Roughly 60% Combined Sewer, 40% Separate Sewer
- Green City, Clean Water - Large-scale green stormwater infrastructure program

The work we do to achieve our mission is...

- **DRIVEN BY DATA AND BEST AVAILABLE SCIENCE**
 - Understand existing conditions and potential future conditions
- **BASED ON SOPHISTICATED TOOLS**
 - Analyze how our systems and infrastructure perform under a range of conditions
- **FOUNDED ON COMPREHENSIVE, WATERSHED-WIDE PLANNING**
 - Evaluate risks and develop short and long-term strategies to reduce risks
- **IMPLEMENTED USING INNOVATIVE APPROACHES**
 - Adaptive management, policy changes, advanced technologies, networks & partnerships

UNDERSTAND

Tropical Storm Ida

Priority Risks to Address

Water quality impacts

Higher temperatures could lead to decreased dissolved oxygen levels, increased algal growth, and changes to treatment processes

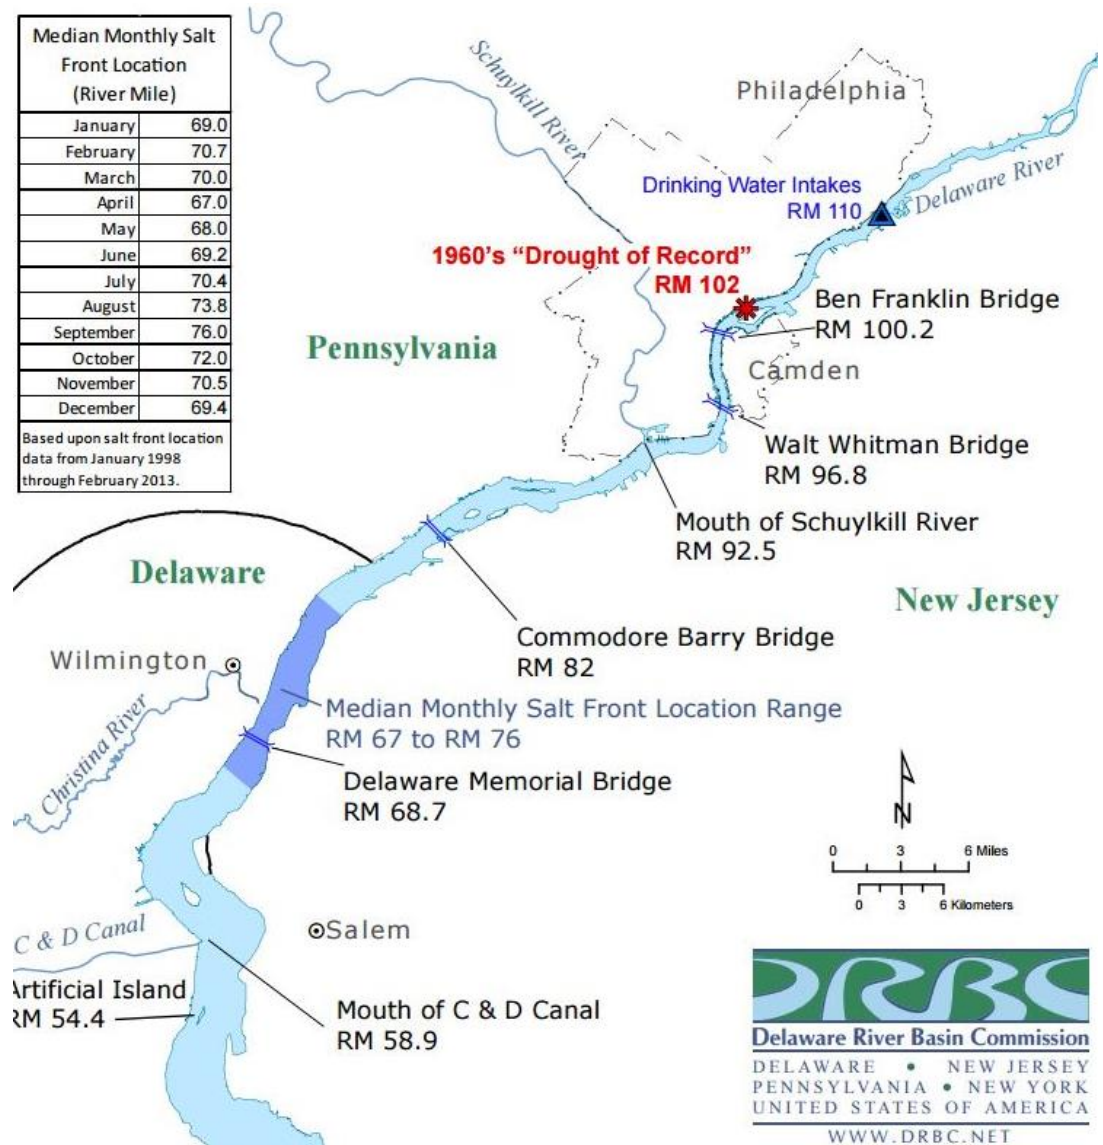

Sea level rise intensified salinity intrusion

Intrusion of ocean salt upstream during drought conditions is a natural process anticipated to become more frequent and severe later this century due to sea level rise

Median Monthly Salt Front Location (River Mile)	
January	69.0
February	70.7
March	70.0
April	67.0
May	68.0
June	69.2
July	70.4
August	73.8
September	76.0
October	72.0
November	70.5
December	69.4

Based upon salt front location data from January 1998 through February 2013.

UNDERSTAND

ANALYZE

IMPLEMENT

How and when will these impacts affect the operations and management of our systems?
What strategies can we employ to reduce risks and maintain current levels of service?

ACTIONABLE SCIENCE IS REQUIRED

"...data, analyses, projections, or tools that can support decisions regarding the management of the risks and impacts of climate change." (ACCNRS, 2015)

Short and long-term strategies to reduce risk

- **Develop in-house expertise** on climate science and risk-based adaptive management approaches
 - **Mainstream** the use of climate change information plans, programs and policies
 - **Conduct risk assessments** to inform adaptation strategies
-
- **Develop adaptation strategies and projects**
 - **Leverage funds and Implement** adaptation projects
 - **Partner and coordinate** with internal and external stakeholders

Guidance is PWD's fundamental reference document for mainstreaming the use of climate change information in PWD planning and design processes

- Actionable climate information
- Tools and visuals to better understand risk
- Updated planning guidance and design standards that consider
 - Useful service life
 - Criticality
 - Risk Tolerance
 - Adaptive Capacity
- Adaptive management approaches

Publicly available version of the guidance document is available here:
<https://water.phila.gov/pool/files/climate-resilient-guidance.pdf>

Climate-informed Planning & Design Guidance Examples

Sea Level Rise and Storm Surge

Philadelphia's two main rivers are tidal – we will be impacted by sea level rise

Potential risks include:

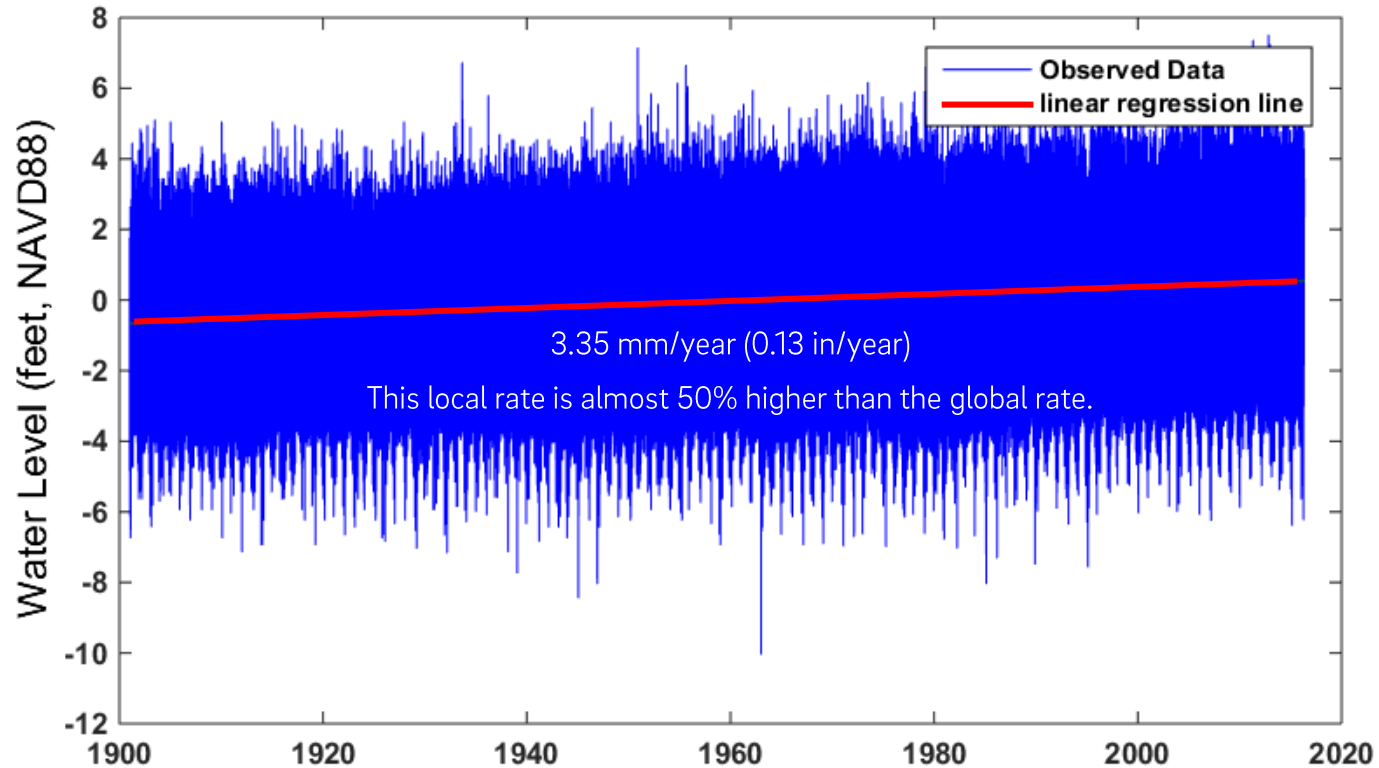

- Flooding of PWD assets
 - Surface and below-grade
 - Treatment plants and pump stations
- Increased energy demand (pumping and treatment)
- Degraded source water quality (salinity)

Actionable science developed includes:

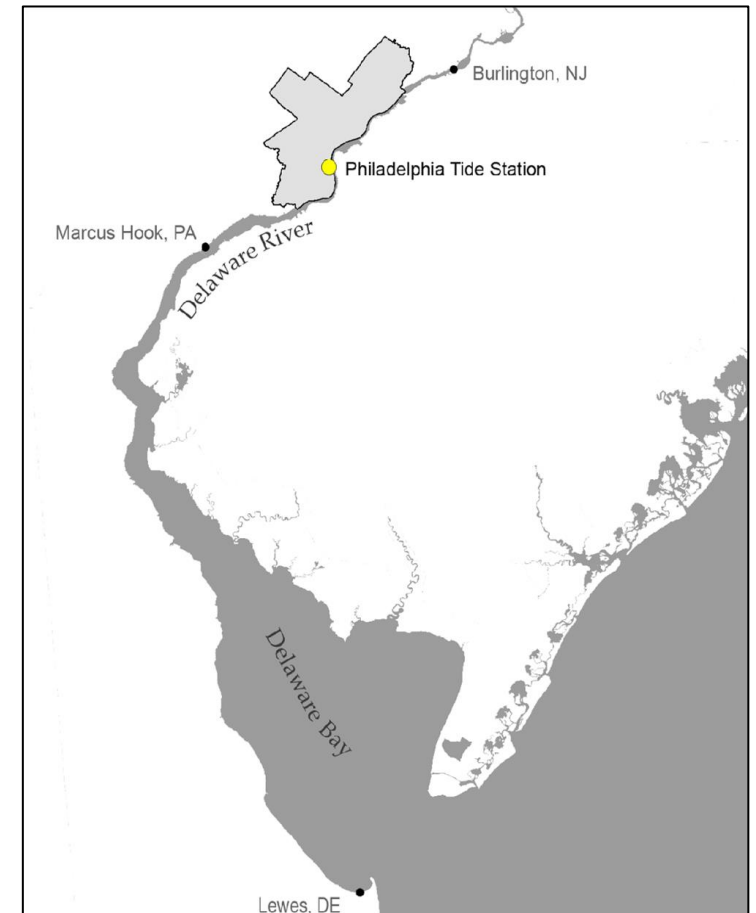

- Analysis of SLR projections and storm surge elevations on Delaware River
- Customized GIS screening tool for PWD assets
- Updated design standards – climate-informed design flood elevation (DFE)
- Analysis with PWD 3-D model of salinity intrusion under current and future sea level conditions

Philadelphia is already experiencing climate change

SEA LEVEL RISE – LOCAL TRENDS

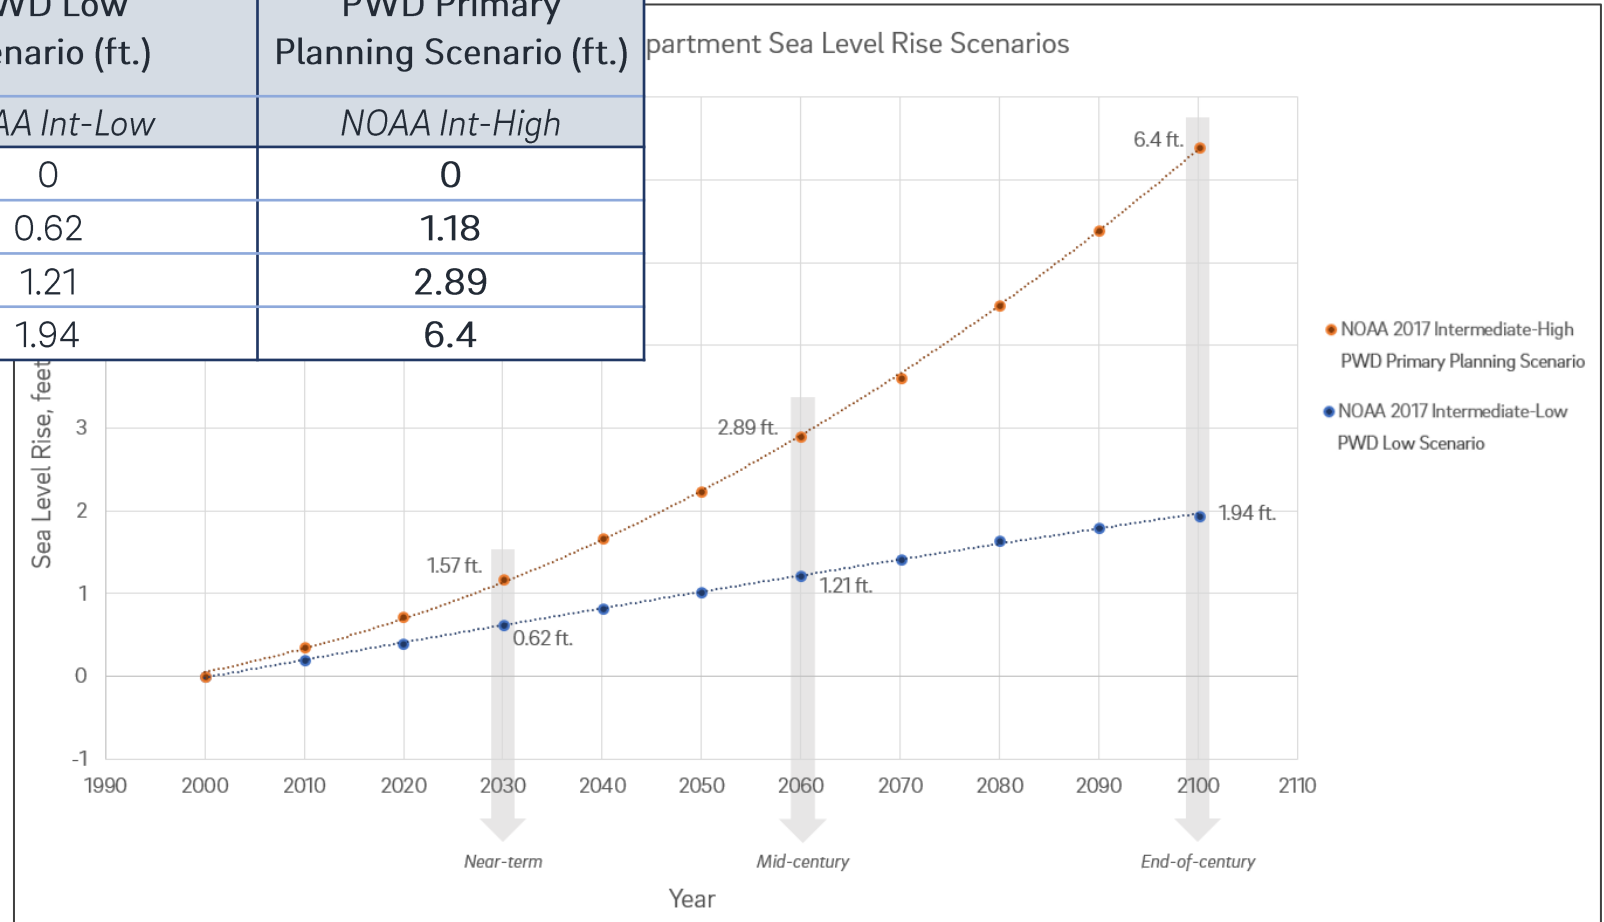

1901-2016 continuous tide level data from Philadelphia's NOAA gauge 8545240

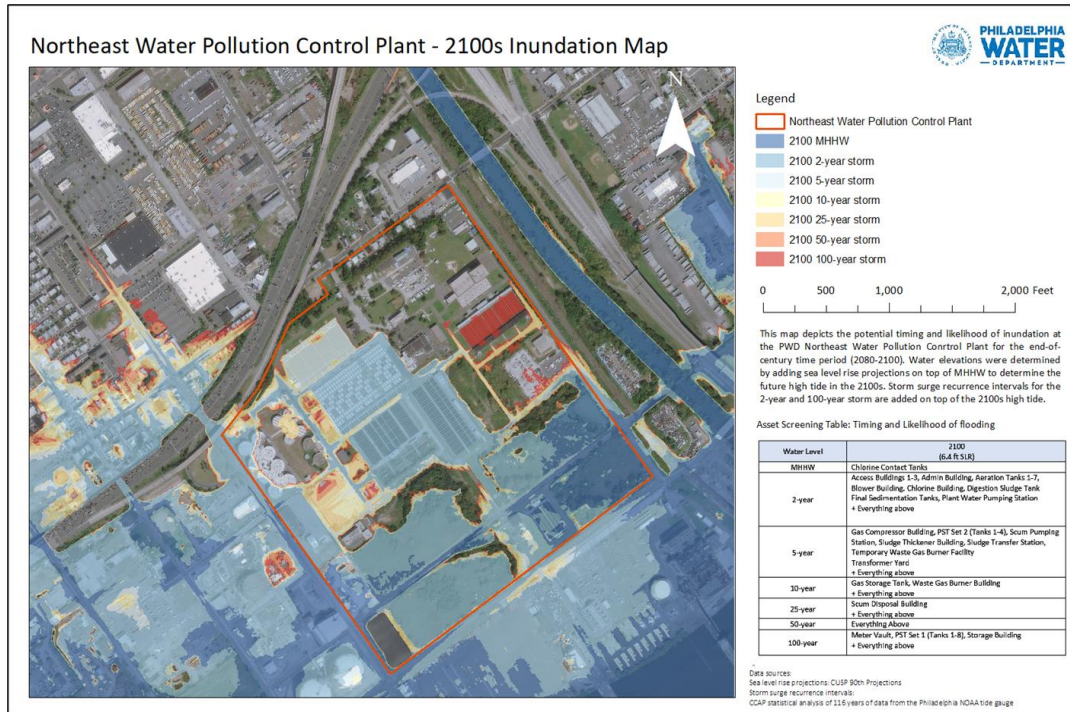

Sea Level Rise Projections

Philadelphia Water Department Sea Level Rise Planning and Design Scenarios		
Year	PWD Low Scenario (ft.)	PWD Primary Planning Scenario (ft.)
	<i>NOAA Int-Low</i>	<i>NOAA Int-High</i>
2000 (baseline)	0	0
Near-term (2030s)	0.62	1.18
Mid-century (2060s)	1.21	2.89
End-of-century (2100s)	1.94	6.4

PWD Inundation Model

Disclaimer: The maps being shared here, and any associated data and information, were created solely as a planning tool for the Philadelphia Water Department (PWD). Those choosing to use this output for external (i.e. non-PWD) purposes should understand the methodologies utilized, including assumptions and known uncertainties and errors therein. PWD inundation maps are not to be distributed without permission from PWD and the Department does not assume any risk or liability associated with their use. For more information, please contact Julia Rockwell (julia.rockwell@phila.gov), Manager, PWD Climate Change Adaptation Program.

Sea Level Rise in Philadelphia

Coastal Flood Inundation Maps using the Primary Planning Sea Level Rise Scenario

Climate Change Adaptation Program | Philadelphia Water Department

[Introduction](#) | [Instructions](#) | [2060s](#) | [2100s](#) | [Highest Astronomical Tide \(HAT...\)](#) | [Documentation](#) | [Design Flood Elevation](#)

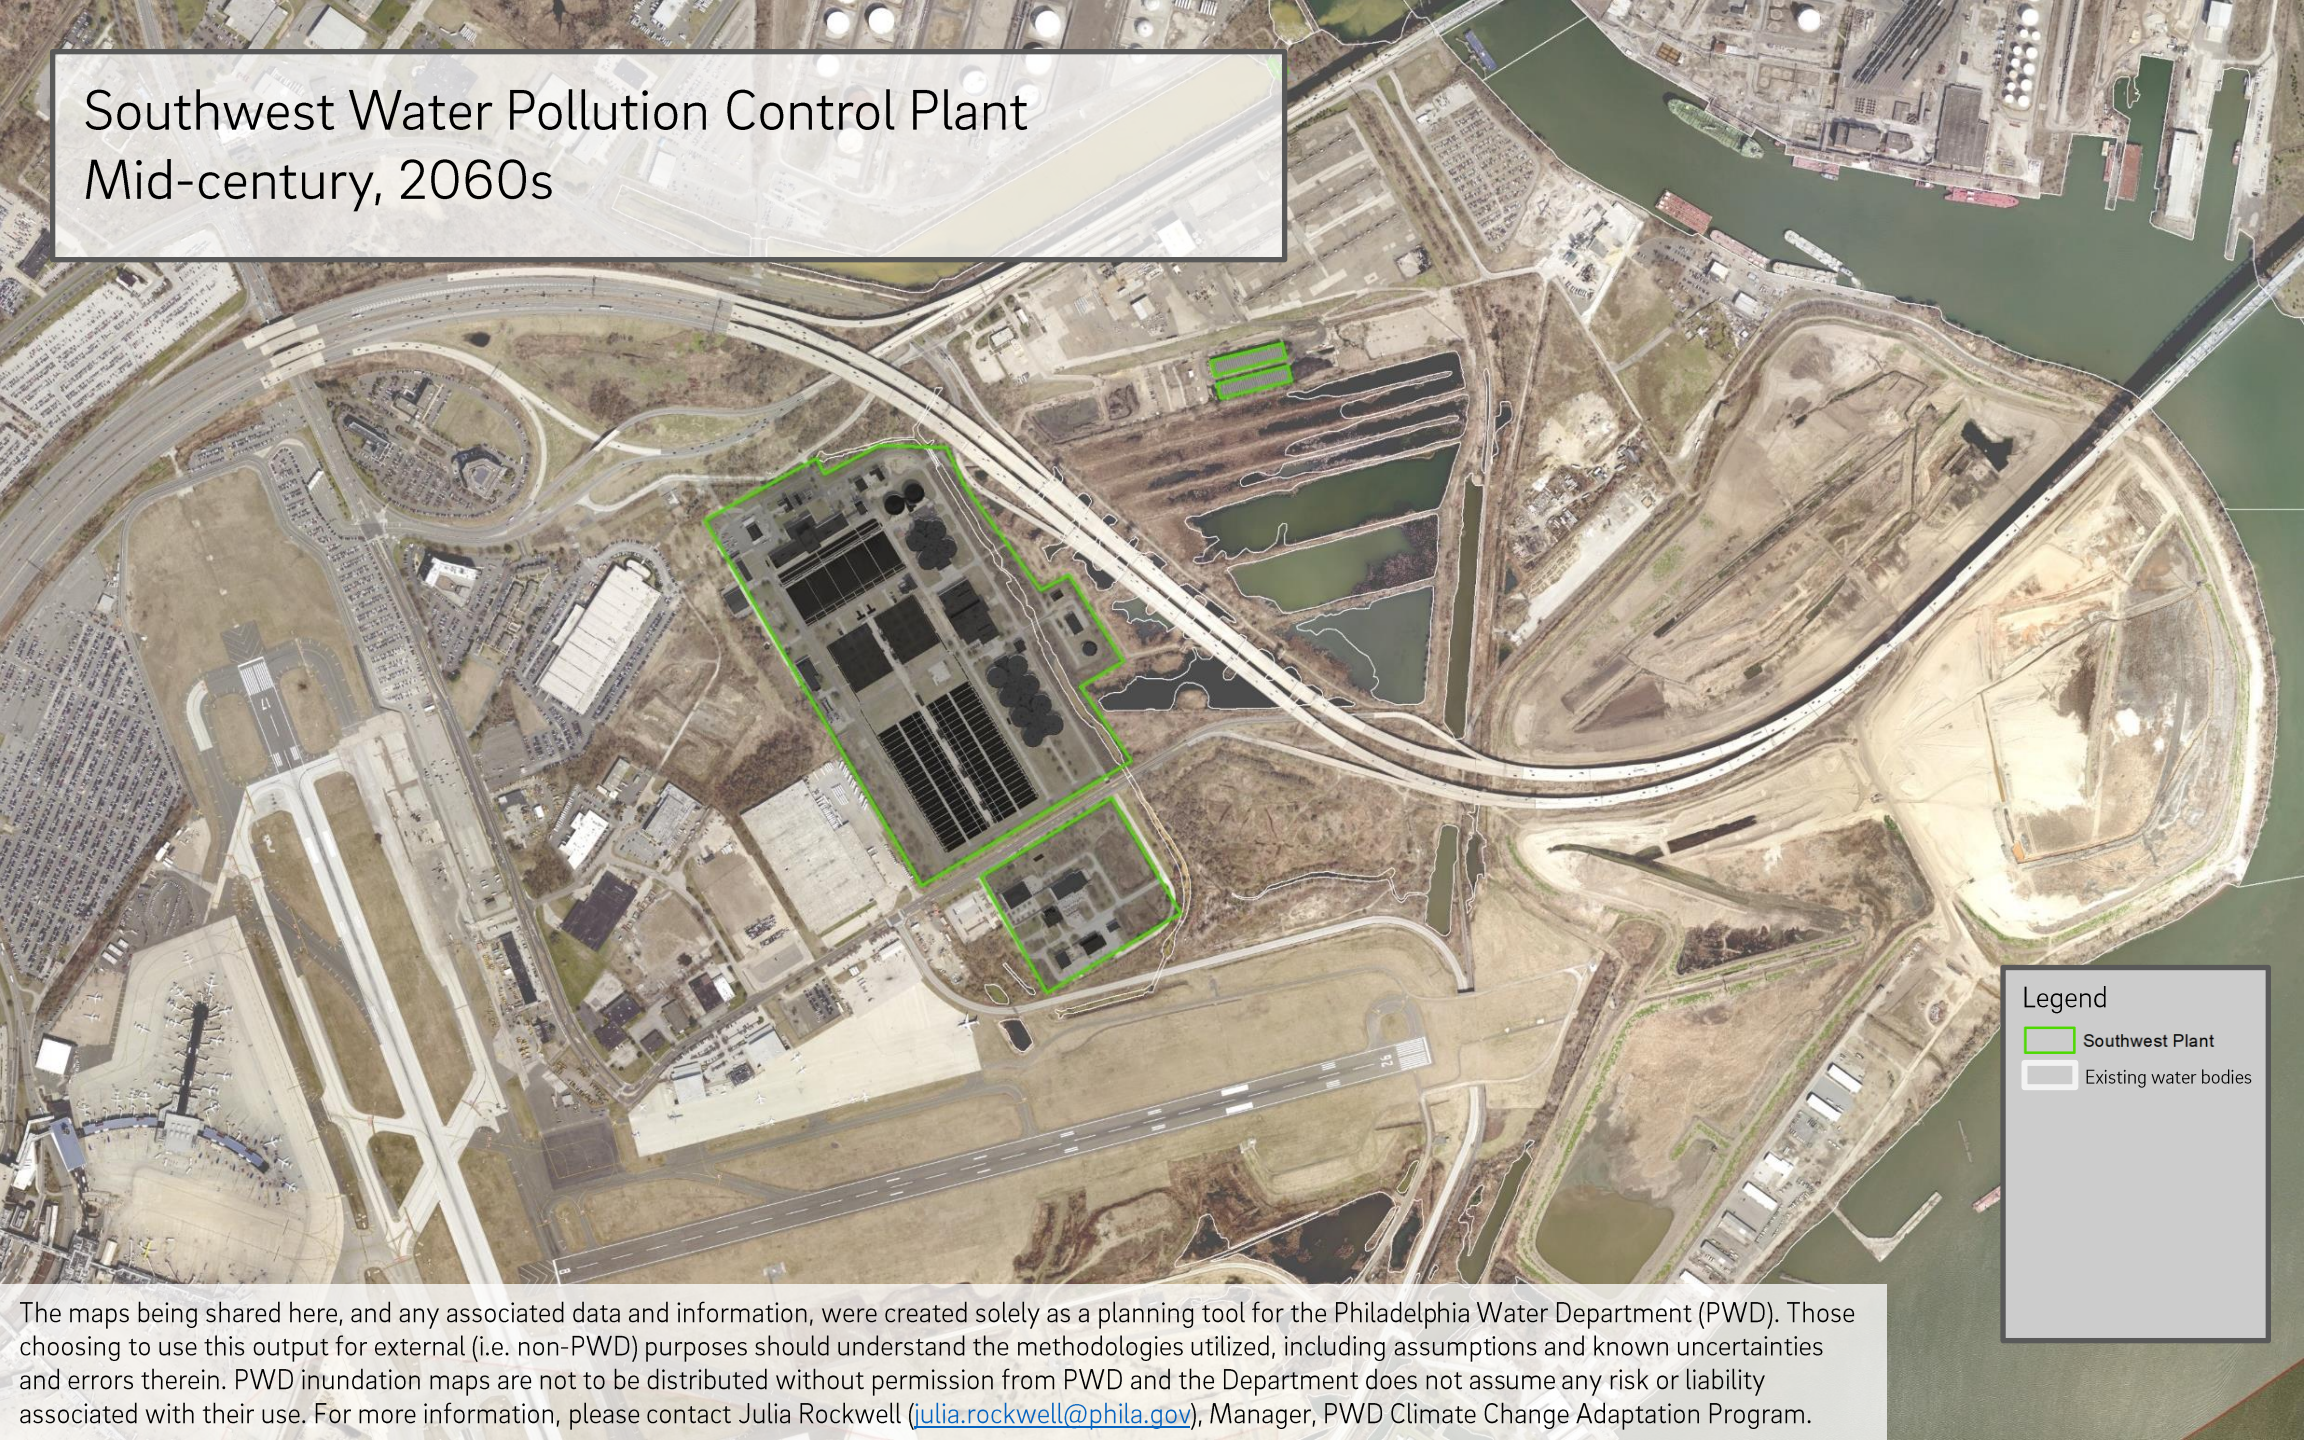

Introduction

The Philadelphia Water Department is preparing for future sea level rise (SLR) and storm surge. These maps were developed by the Climate Change Adaptation Program to help PWD staff understand the potential timing and likelihood that an asset will be exposed to coastal floodwaters using PWD's Primary Planning scenario for SLR in combination with storm surge projections. It also serves as the screening tool to determine whether the Design Flood Elevation applies to projects (See *Design Flood Elevation* tab). These forward-looking inundation maps can be used to:

- Determine whether an asset is within the current FEMA 100-year or 500-year floodplain
- Determine whether an asset is within estimated future floodplains that consider sea level rise
- Evaluate project placement to better avoid future flood exposure that may not currently exist
- Perform high-level vulnerability assessments for specific projects or systems
- Create visuals for planning assessments and reports that depict the estimated timing and likelihood of future flooding
- Determine if the DFE applies to new projects or upgrades to existing assets.

A visual comparison between the end-of-century (left) and current FEMA (right) 100-year floodplain in Philadelphia. Note, the future 100-year floodplain was only mapped for coastal regions.

Coastal Design Flood Elevation

PWD Design Flood Elevations

Asset Type	Near-term <i>End of useful life does not extend beyond 2050</i>	Mid-century <i>End of useful life: 2050-2075</i>	End-of-century <i>End of useful life: 2075 +</i>
non-critical assets	Current floodplain regulations apply	12.0 ft. NAVD88, <i>or the protective elevation established by local regulations, whichever is higher</i>	
critical assets	Current floodplain regulations apply	13.75 ft. NAVD88	End-of-Century DFE <u>OR</u> 13.75 ft. NAVD88 <u>+ Adaptive Management Plan</u>

Criticality

Useful Service Life

Adaptive Capacity

is considered when developing the AMP

Coastal Design Flood Elevation

MHHW	SLR	100-year (Stillwater)	Wave Effects	Freeboard	Total
3.66 ft.	2.89 ft.	3.95 ft.	1.5 ft.	1.75 ft.	13.75 ft.

Risk Tolerance

Accepted risk tolerance is storm surge associated with 100-year event)

Uncertainty

Safety factor accounts for multiple sources of uncertainty

A conservative sea Level rise projection (NOAA 2017 Intermediate-High scenario) was chosen for the DFE considering PWD's low **adaptive capacity**, low **risk tolerance**, generally long **useful service life** of assets and the **criticality** of facilities in the floodplain.

However, given the large **uncertainties** associated with sea level rise projections, assets with a useful service life beyond 2075 can still use the mid-century projection (2060s), as long as an adaptive management plan is developed in tandem.

Does the Design Flood Elevation Apply

There are three components that determine whether the DFE is required for your project: exposure, criticality and useful lifespan. The floodplain maps found in this tab are necessary for determining your project's **exposure** to coastal flooding and ultimately, if the DFE requirement applies to your project or asset.

Because this requirement goes above and beyond current floodplain regulations, an asset that is designed, constructed, or flood-proofed to the DFE, it is likely to be protected from coastal flooding through mid-century (2050-2075).

The map to the left contains the DFE Screening Layer (magenta) as well as FEMA's 100-year (blue) and 500-year floodplains (orange).

How to use this tool for the DFE

How can I use this tool to determine if the DFE applies?

This guide supplements information in the flow chart, providing planners and designers with the steps necessary to determine if a DFE applies to a particular project.

Determine asset exposure to inundation

It is first necessary to determine whether the project location is within a current or future floodplain. A project location may not currently be located within a floodplain, but due to SLR, may be within a future floodplain. If the project is within a current or future floodplain, one of the DFFs applies.

How does the DFE apply to my project?

Statistical parameters for the PHL 1997-2017 observed time series compared to the PHL 2050-2070 and 2080-2100 projected (i.e. climate-adjusted) time series.

Precipitation Projections

Seasonal precipitation for observed PHL gauge data (1997-2017) and climate-adjusted future time periods for mid (2050-2070) and end-of-century (2080-2100).

Increasing Precipitation

In Philadelphia, rainfall is expected to increase in intensity, with the largest increases occurring for the biggest storms

Potential risks include:

- More frequent combined sewer overflows (CSOs)
- Increased erosion and sediment transport
- Increased riverine flooding
- Increased infrastructure-based flooding (basement/sewer back-ups)

Actionable science developed includes:

- High resolution precipitation projections for use in modeling applications
- Future design storm events (common tool in infrastructure design)
- Stochastic rainfall generator to evaluate current and future precipitation variability

Modeled flooding for synthetic event: Hurricane Sandy's Delaware River water levels + Hurricane Irene's Darby-Cobbs stream flows

Building Resiliency

Green City, Clean Waters Program

Green City, Clean Waters continues to make tremendous progress since launching in 2011. We exceeded our 10-year pollution reduction goal, with new infrastructure investments now keeping nearly **three billion gallons** of stormwater runoff and sewer overflow out of local waterways.

We've installed more than
2,800 green tools...

...at nearly
800 sites
throughout the city...

...keeping more than
2.7 billion gallons
of polluted water out of our rivers.

City of Philadelphia Flood Risk Management Program

The Philadelphia Flood Risk Management Program is led by a task force comprised of more than 15 City departments/agencies as well as state and federal partners

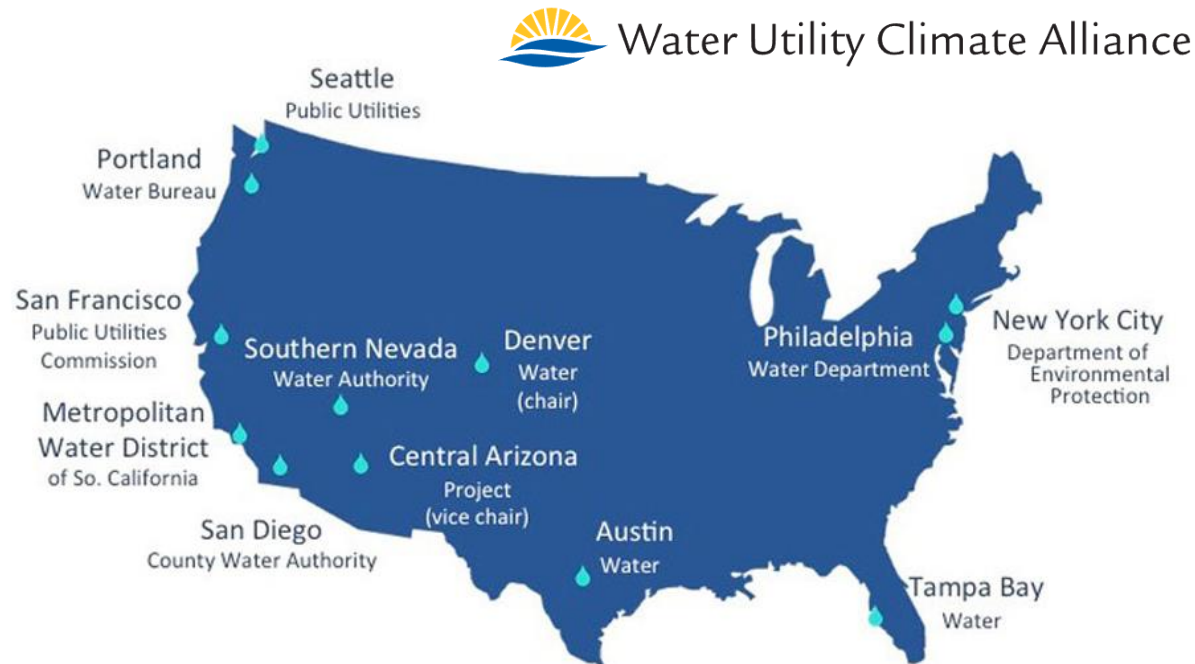

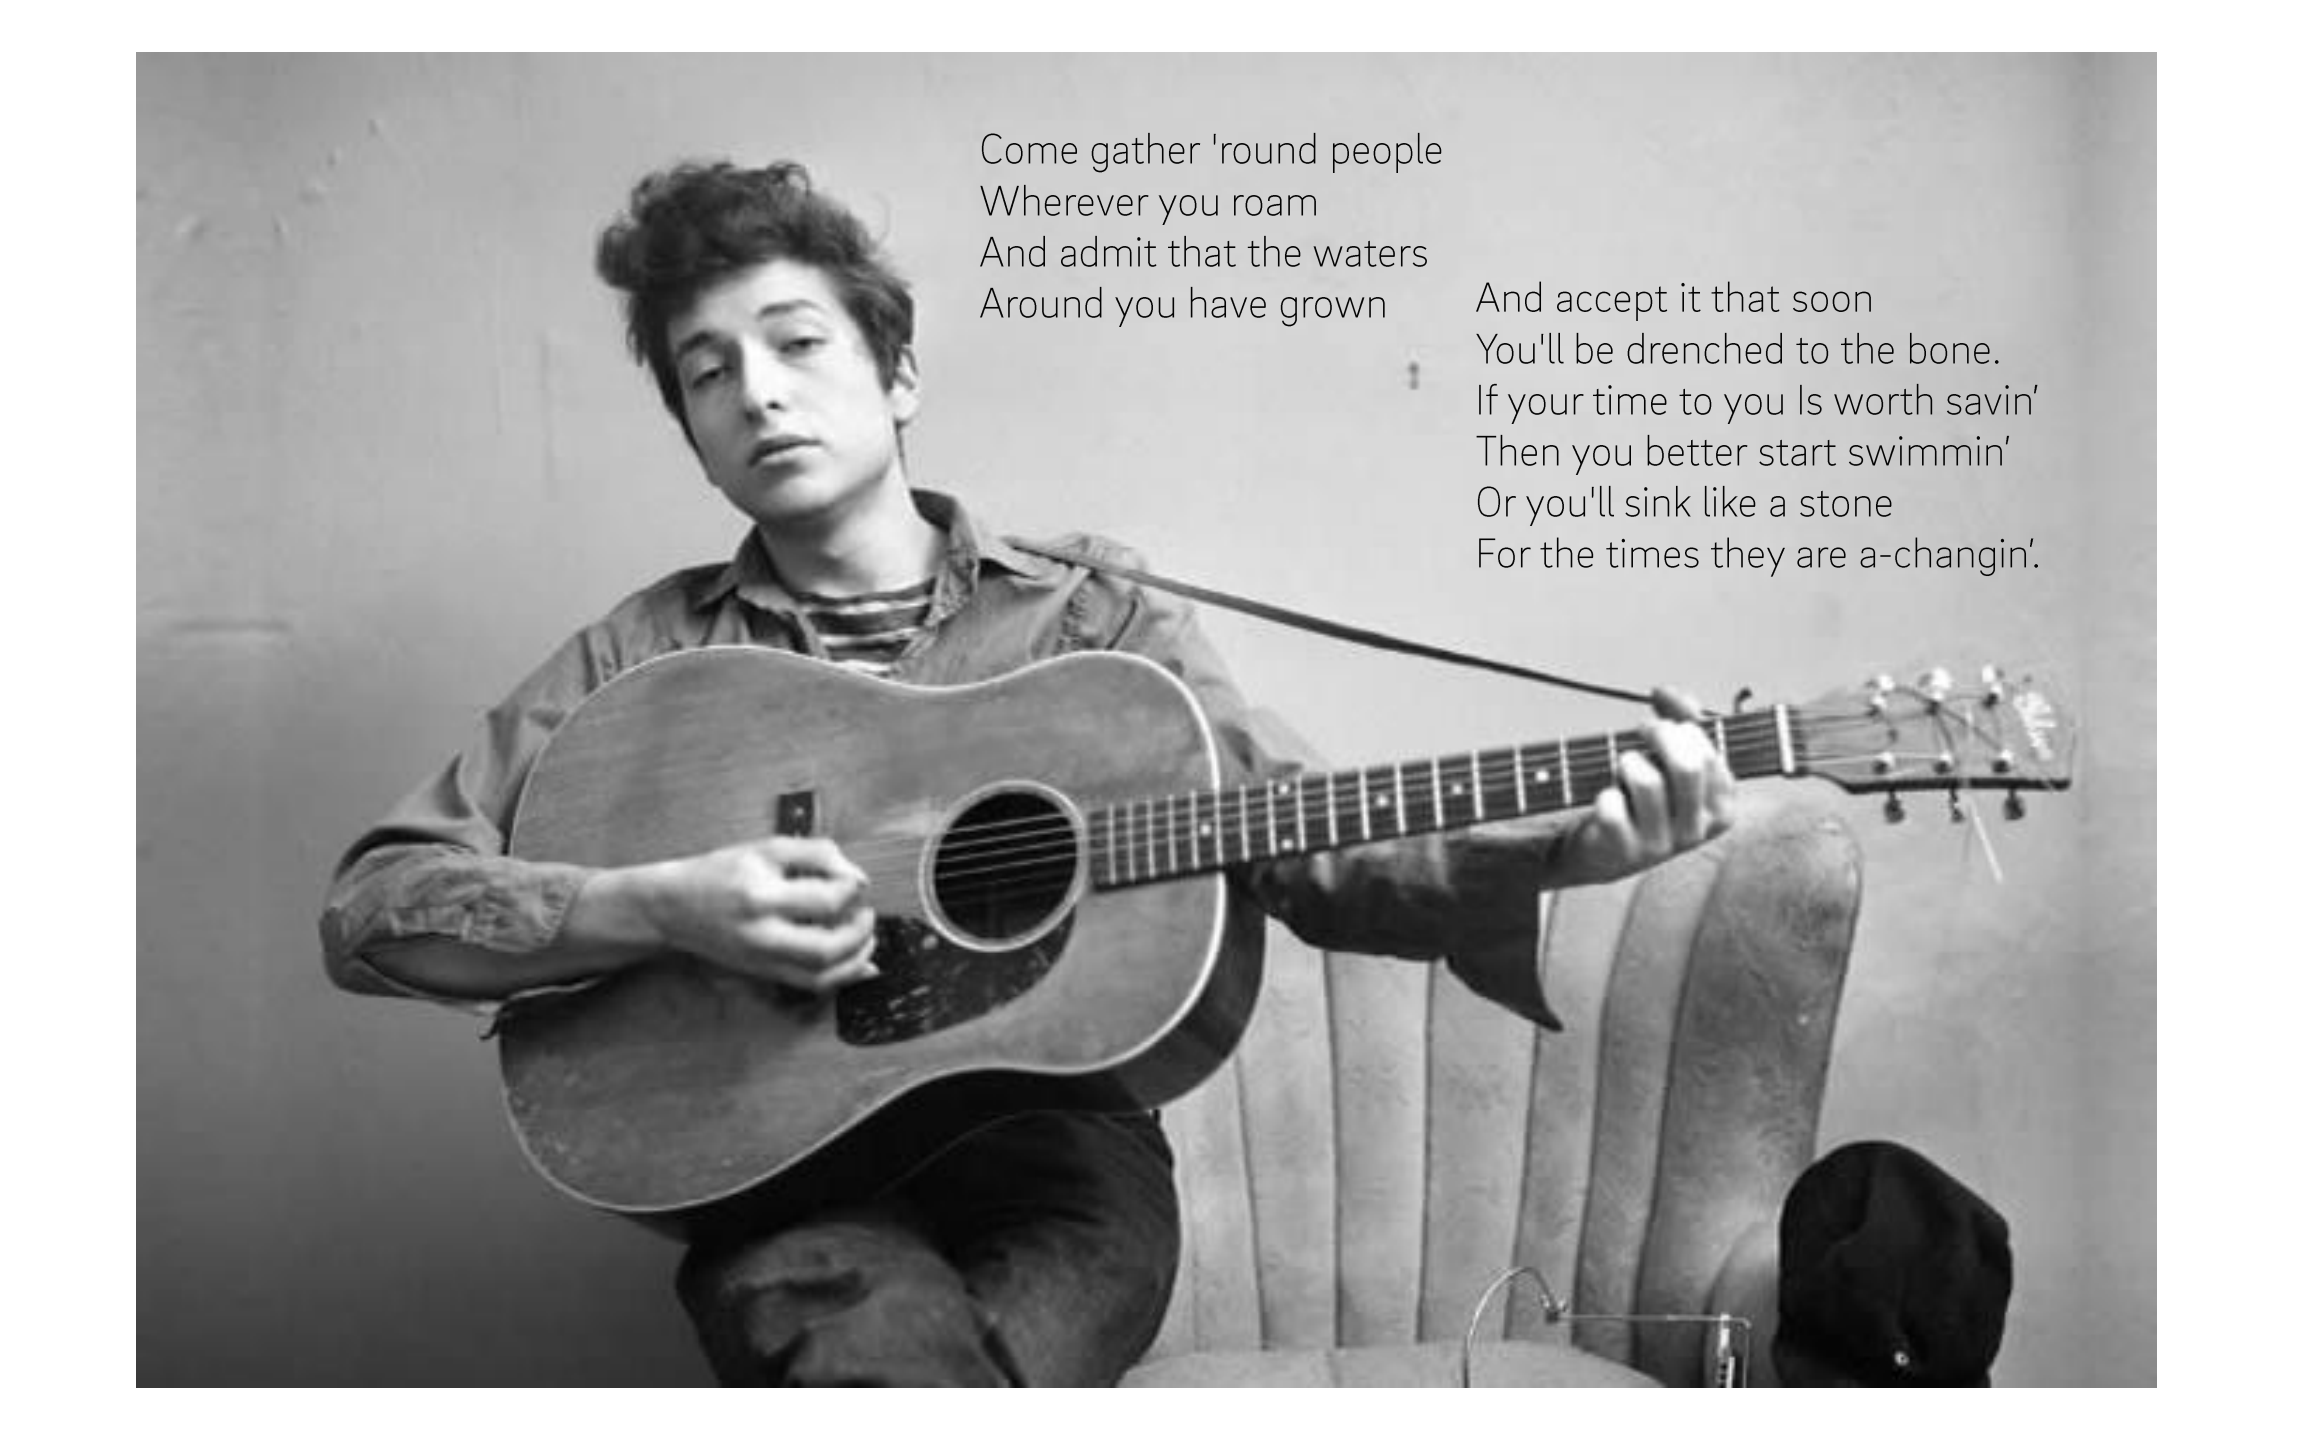

- Provide public information
- Update and enforcing flood maps & regulations
- Reduce flood damages
- Increase flood preparedness

Where we're headed

- Continue work on priority initiatives that will help mainstream the use of climate information (risk assessments, climate planning & design guidance)
- Move from planning to implementation of adaptation strategies
- Continue building internal capacity and engaging with city and regional partners
- Continue partnering with and leveraging knowledge from peer cities/utilities

Come gather 'round people
Wherever you roam
And admit that the waters
Around you have grown

And accept it that soon
You'll be drenched to the bone.
If your time to you is worth savin'
Then you better start swimmin'
Or you'll sink like a stone
For the times they are a-changin'.

Thank You!
